About Me

Data Science student specializing in Deep Learning (NLP & Computer Vision) and Predictive Analytics, with experience building end-to-end data solutions from data engineering to deployment via FastAPI and Streamlit. Worked on large-scale datasets (48K+) to develop predictive and analytical models for risk assessment and trend analysis.

Project

Loan Data Analysis – Default Risk Modeling & Segmentation

- Analyzed 30K+ loan records and built a predictive model to identify early default risk, optimizing for high precision on high-risk borrowers.
- Simulated risk mitigation strategies (Thompson Sampling) to estimate potential default reduction scenarios (12–21%).
- Delivered explainable insights via SHAP values and Power BI dashboards for risk management stakeholders.

Shopee Review Analysis – App Performance & Drift Detection

- Curated and filtered 30K+ app reviews across versions to ensure stable and reliable trend analysis.
- Clustered customer complaints into actionable categories (Shipping, UX, Technical) using contextual language embeddings (IndoBERT).
- Detected temporal topic drift, identifying UX issues as the fastest-growing customer pain point.
- Built a sentiment classifier to resolve rating–review text inconsistencies and improve data reliability.

Crowd Counting with Deep Learning – Computer Vision Project

- Developed a deep learning model for crowd counting using density map estimation to handle dense and occluded scenes.
- Automated preprocessing to generate density-based training labels from point annotations.
- Achieved MAE 29 on held-out test data, demonstrating robustness to dense crowds and occlusions.
- Enhanced model transparency by generating heatmap visualizations to validate spatial estimations against ground truth data.

Power BI Sales & Customer Analytics Dashboard – Business Insights Project

- Built an interactive dashboard to analyze 48K+ e-commerce transactions, providing end-to-end visibility into real-time sales performance.
- Identified revenue growth patterns and sales channel dominance to support business resource allocation decisions.
- Detected country-level refund anomalies to support investigation of potential international market risks.
- Optimized data structures using DAX to create custom metrics and calculated fields for strategic decision-making.

Education

Bina Nusantara University – Data Science
Current GPA: 3.27

Sep 2023 - Sep 2027 (Expected)

Skills

Programming: Python (Pandas, NumPy, SciPy), SQL, DAX

ML/DL: CNN, IndoBERT, CSRNet, Classification, Clustering, Forecasting, Anomaly Detection

NLP & Analytics: Text Mining, Topic Drift Detection, Time Series, Bayesian Optimization

Tools: PyTorch, Scikit-learn, Power BI, Git/GitHub, Hugging Face, FastAPI, Streamlit

Certification & Languages

Languages: Indonesian (Native), English (TOEFL ITP: [623/677] | Professional Working Proficiency), Chinese (HSK 2 | Elementary Proficiency).

Data Science & Machine Learning: IBM (Granite), Digital Talent Scholarship (ML), Udemy (Deep Learning, DS for Business)
